

Web Service Composition framework and Ontology

Content

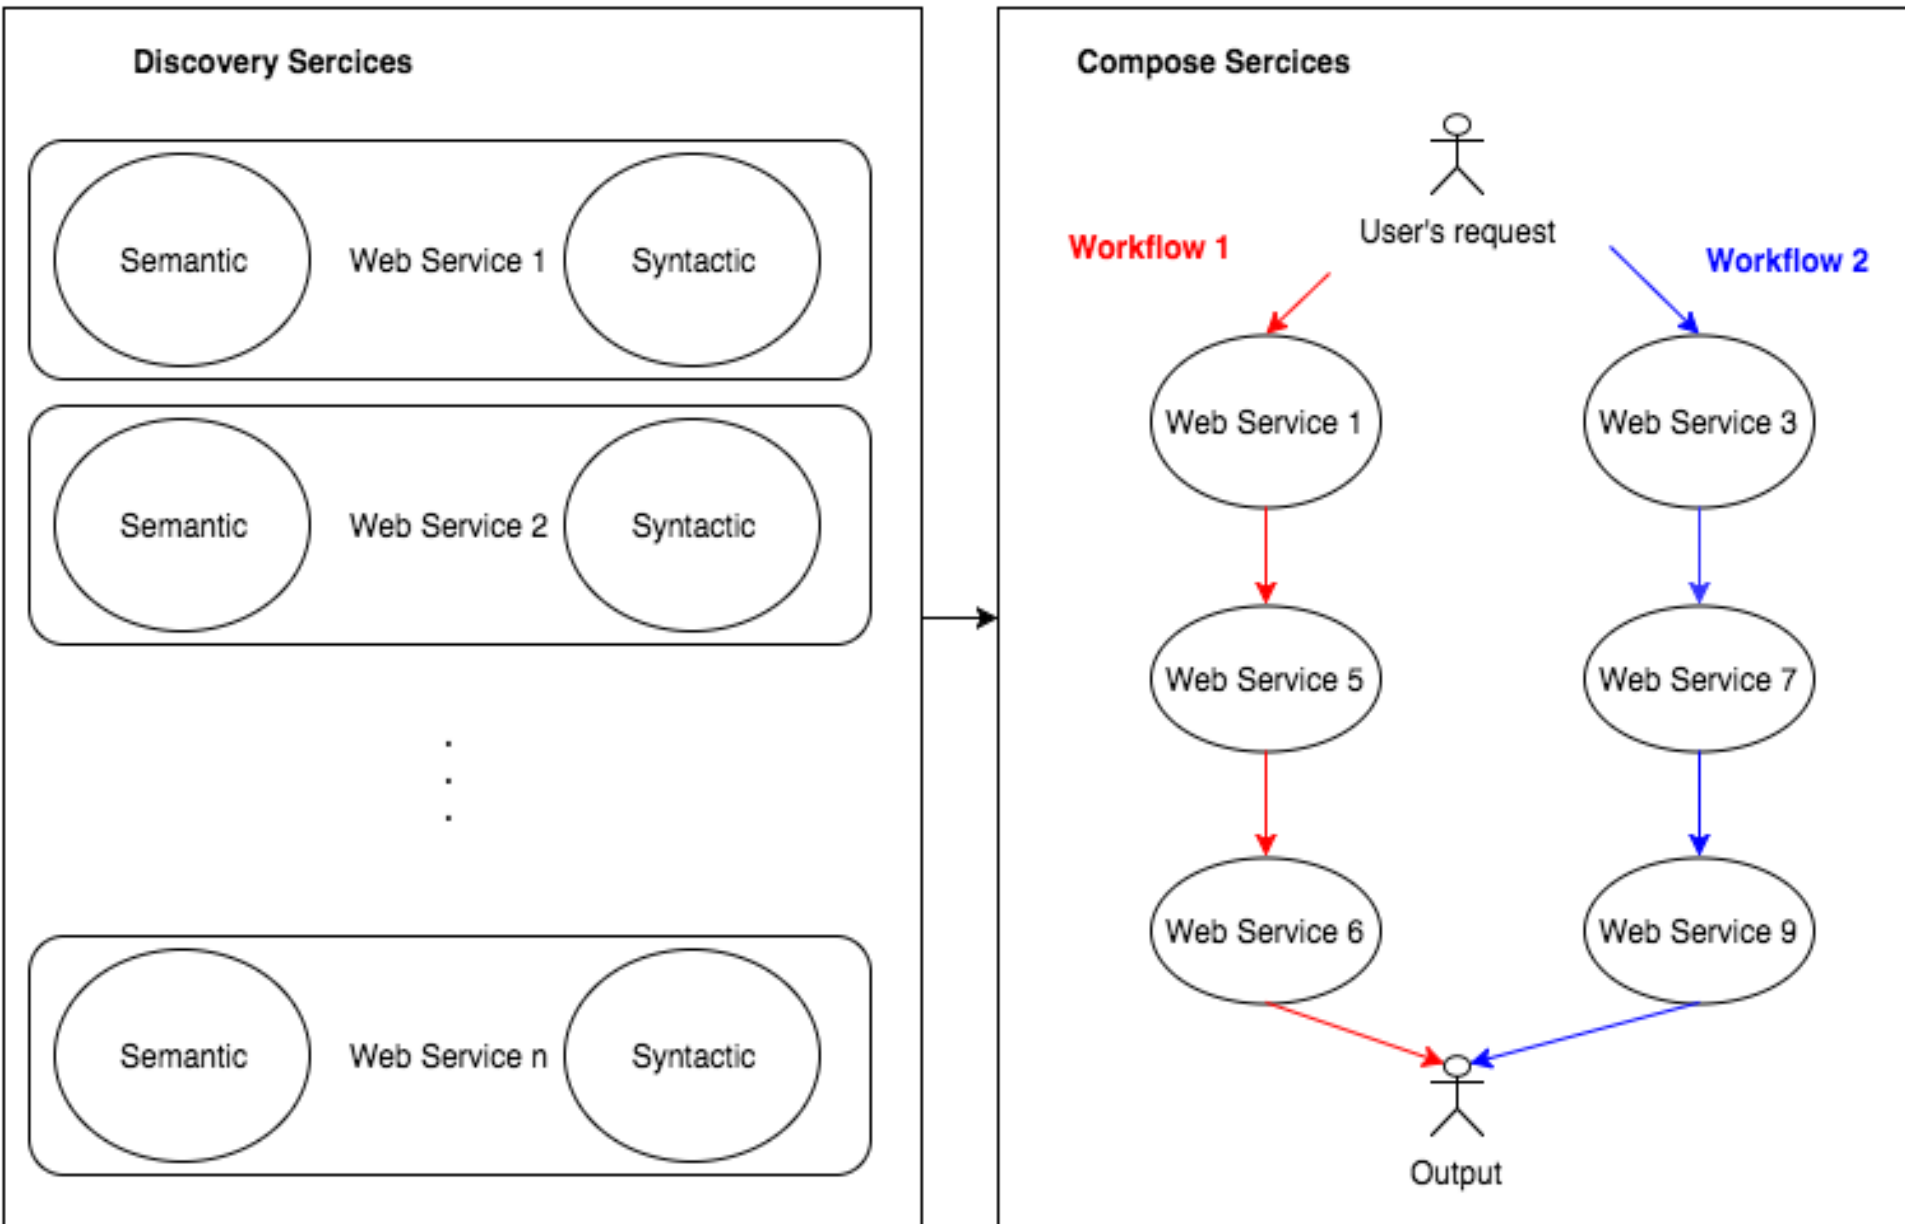

- Introduction to Web Services Composition Framework
- Ontology (Definition and Role)
- Current Ontology Framework
- Future Work

Introduction to Web Services Composition

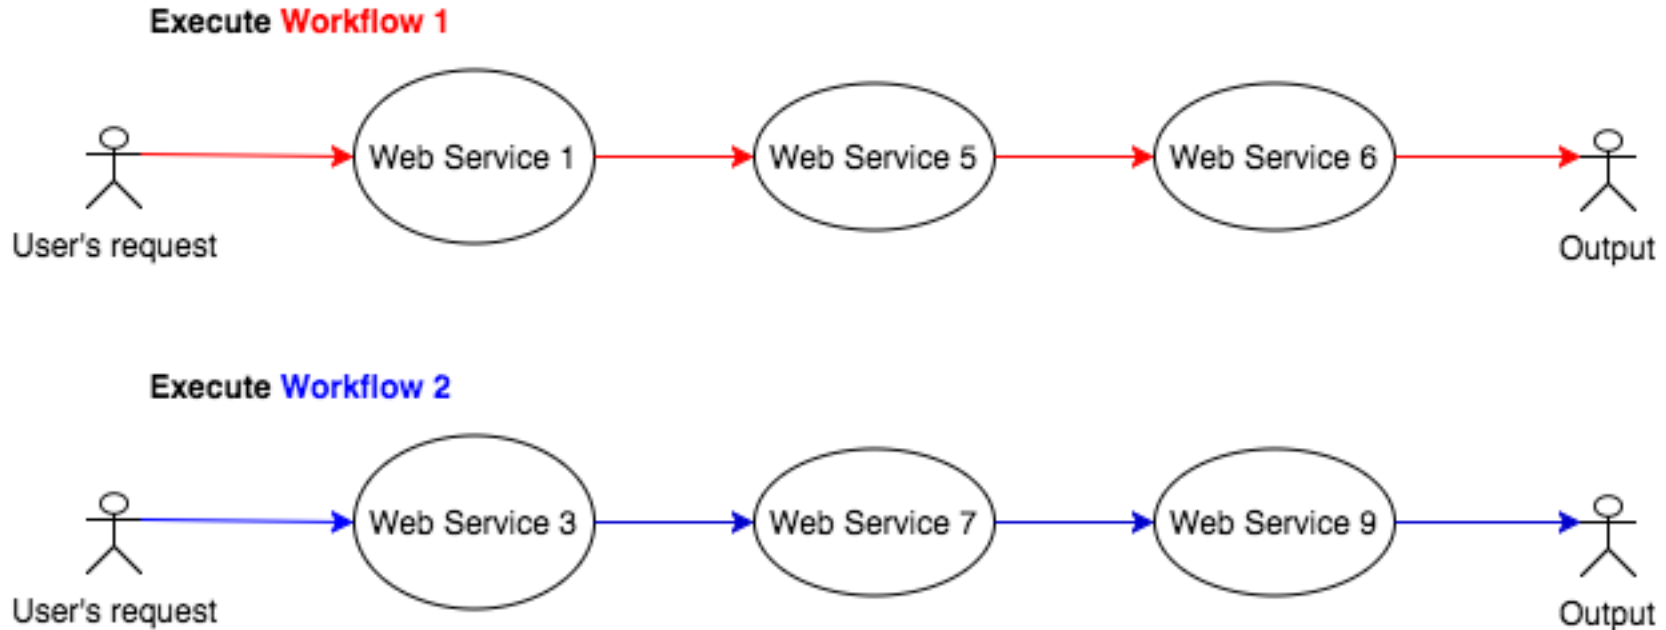

- Web Services Registry

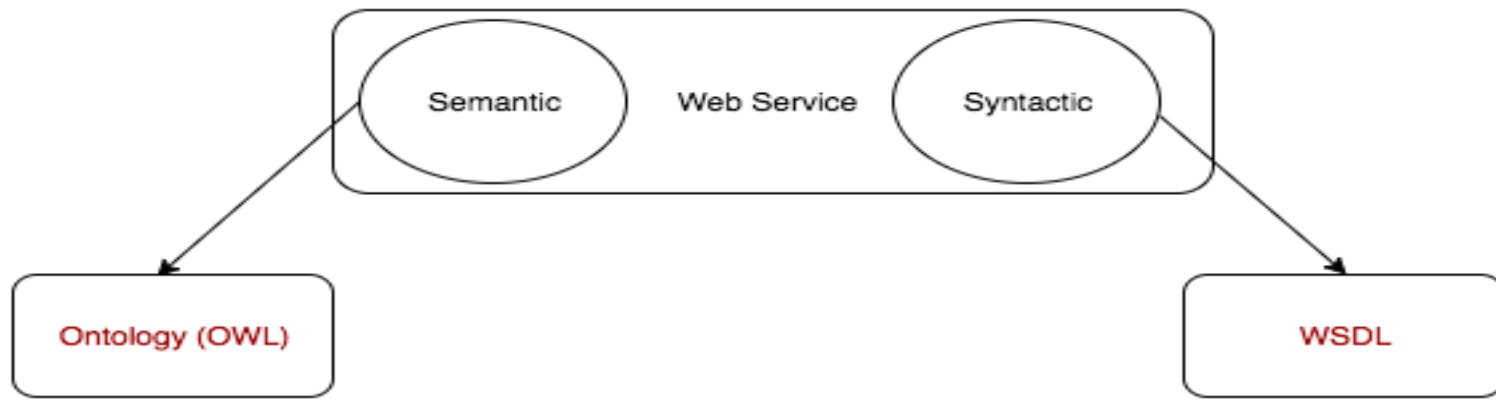

- Generate Workflow based on AI Planning

- Execute Workflow

- Web Service Component

Ontology

- Definition : In computer science, an ontology is a formal naming and definition of the types, properties, and interrelationships of the entities that really or fundamentally exist for a particular domain of discourse.
- Role of Ontology in Web Semantic: The most important role of Ontology in Web Semantics is to help data integration. Basically, it helps Web Services that comes from different Service Providers, can understand others (about Semantic).

Ontology

- Example:
 - A bookseller may want to integrate data coming from different publishers.
 - Data can be imported from publisher's database
 - However, one database may use the term “author”, whereas the other may use the term “creator”
 - To make data integration complete, an extra definition should be added to describe the fact that the relationship described as “author” is the same as “creator”. (maybe “writer” “maker”, etc.)
- => This is an ontology

- Example in our project: Simple WorkFlow => Build Phylogenetic Tree from content of a Web Page

Web Service 1

Web Service 2

Ontology has to describe that *list_of_species_name* is TAXA(s)

Web Service 1

Web Service 2

Current Ontology Framework

- We are building Ontology Framework based on CDAO ontology (See it on Protégé)

Future Work

- Full Ontology for Phylotastic Project
- Full features for Web Service Composition framework : Discovery, Composition and Execution
- User's Interactivities :
 - How to specify what users want ? (Controlled Natural Language, Spoken Language APIs, Speech Progress)
- Generate Workflow:
 - Reliability
 - Constrains

Future Work

- Contingency
 - Failures in generation
 - Failures in execution
